

Finanțat de Uniunea Europeană – NextGenerationEU — Project: Acme Orders Platform · Contract: 760123/23.05.2024 · Beneficiary: Acme Test SRL

What it is

Operators create orders in the web app; the API queues fulfilment; a worker charges the payment provider and stores the result; the web app polls until done. It replaced a spreadsheet process that had no history.

Architecture

Three things to know

1. **Polling, not websockets** — a deliberate choice; jobs take 5–40 s.
2. **Any operator can retry any order** — no ownership check yet on `POST /orders/:id/retry`.
3. **stripe is one major behind** — contained in one file, upgrade planned.

What to monitor

Signal	Normal	When off
fulfilment queue depth	< 20	worker down or provider slow
Failed jobs per day	0–2	inspect <code>order_jobs.error</code>
